

Dear Provider,

As communicated in the Welcome Packet, as part of the research process for Magic Quadrant and Critical Capabilities for AI Application Development Platforms 2026, we are asking participating providers to record a Product Demo to supplement the provider questionnaire which focuses on product features as of 1st August 2026.

Please ensure that you allocate the time necessary to complete the product demonstration recordings by the deadline indicated in the Welcome Packet, **24th August 2026, 11:59 pm PST**. Submission guidance and requested areas of focus are described below.

### Submission Guidance

- The demo, showcasing the use case and capabilities, should be no longer than **60 minutes**. Please ensure that your submitted material does not exceed this time frame.
- Product Demo(s) should be submitted via the Gartner Provider Information Portal, using the below instructions:
  - Please, note: Only administrators can upload and submit Product Demos to the portal.
  - Click on the “Dashboard,” on the top right corner, under “My Assignments,” click either on “View Details” or on the “Product Demo” button.
  - If there is no file to be shared with Gartner, please, select “Do not wish to upload a file.” An optional text box will be displayed where you can provide additional information (if needed).
  - The portal allows a maximum size of 4GB per file — up to ten files are allowed.
  - The accepted formats are image/\*, video/\*, audio/\*, .pdf, .doc, .docx, .csv, .ppt, .pptx, .txt, .xls, xlsx and .rtf.
  - Once the files are uploaded, please click on “I Agree —Submit Response.”
- If submitting a video, please record your videos in **.mp4 format**, of sufficient quality so that the presented material is legible (**720p** or higher resolution is typically sufficient).

- The focus should be on demonstration of capabilities outlined, and not on the quality or creativity of the submitted content; no credit will be given for creativity or elaborate production efforts.
  - Instead, please focus on effectively demonstrating functionality.
  - Do not showcase the overall product as that was done in the previous submission.
  - This demo must showcase the features and capabilities of your platform as of 1st August 2026 that are now GA.
- For situations where multiple products are under evaluation, please upload a demo for each product.

## Product Demo Content

Below you will find Gartner's guidance on how to structure your Product Demo and what content to include:

- For videos, please note that we will stop watching after a total of 60 minutes.
- We will not watch videos that need to be played back at less than normal (1x) speed.
- Videos need to be recorded in english or utilize english subtext.
- Focus on demonstrating the features of your platform as of 1st August 2026.
  - Please use this as an opportunity to showcase the full product
- Please present your demonstration as if you were presenting to a prospective customer.
- There are no restrictions/guidelines around specific datasets to be used for the demonstration.
- Prerecorded modules can be used if available, as long as it is clearly indicated which functionality items the modules are intended to address for the scope of this evaluation.
- Please ensure the demos provided are in english.

Please use the following scenario for your demo submission. Choose a segment that best fits the features you want to showcase that were made GA on 1st August 2026.

You are the owner of an investment bank offering a variety of retail and commercial services including traditional checking/savings accounts, retirement, along with investment services. The bank will operate in the US, Europe, and Chinese markets predominantly and you must ensure you meet the regulatory requirements of these regions.

You want to develop an AI application to help you research the market and identify relevant opportunities. This AI application will have both internal and external customers and you need to have the appropriate guardrails in place. Please start with this problem statement:

"I have opened a new bank near the Texas Stock Exchange (TXSE) in Dallas, Texas. Please help me design a strategy and theme to operate the bank, including but not limited to know your customer (KYC), opening checking and savings accounts, providing retirement and investment services. In addition to the TXSE, the bank will also use the NYSE, Nasdaq, and the major stock exchanges in Europe. The strategy must include the ability to detect fraudulent accounts and transactions. Build a business plan, recommend the operating model, provide the staff recruitment requirements including salary, marketing and promotional strategies. Provide one best option rather than multiple choices. Based on the options, help me also generate a FAQ document for the customer to understand the details of the bank and its various services."

- First, demonstrate the process of building an AI deep research agent to perform detailed analysis using an agentic framework. Please demonstrate your platform's ability to help with design, implementation, testing, deployment, and operationalization. The deep research agent should take the user's input, use LLM(s) to optimize and refine the query, and break it down into sub-questions or specific aspects to investigate.  
Generate a research plan: Define the key objectives, research methods, evaluation criteria, and expected outcomes for the research.  
Use an LLM to create relevant search queries based on the refined research question and generate the plan, involving humans in the loop for review and refinement.  
Utilize tool calling/MCP, such as web search APIs, to gather results.  
Divide the research into sections and design and implement the multi-agent collaboration to enable parallel processing and efficient information collection.  
Include a human-in-the-loop to refine or adjust the content.  
Incorporate multimodal content for both input(data analysis charts as an example) and output (graphics/logos/store fronts) as needed.  
Combine the content from each section, including an introduction and conclusion, into a comprehensive final report.  
Generate one specific chapter featuring a suggested list of services, using a combination of text and images, but also speech.  
The final output should include citations for all sources and be exported as a PDF.  
Throughout the application lifecycle, demonstrate IDEs/low-code/high-code/graphical-based development, your model catalog, testing/validation, data preparation, tracing, evaluation,

debugging, agent operations, observability, model cataloging, deployment, orchestration, cost management, and control processes whenever relevant.

- Second, generate an AI assistant based on the grounding information from step 1 for your external customers. Retrieve detailed item information, including the services descriptions, with at least text and images. Generate appropriate images of the services and enable the services to be output as speech that allows the user to track the progress of their accounts and investments.

Demonstrate:

- How you use automatic quality control to verify the format, length, filter, irrelevant information.
  - How to enable the human-in-the-loop review to update the description of the services.
  - How to use A/B testing validation to test the output with various models.
  - How to establish a Continuous feedback loop from the AI application
- Third, develop an AI Agent for the customer of the bank, help your client open an account, validate you can do business with them, and take advantage of the bank's various services. Demonstrate grounding capabilities, including both Context/Prompt engineering and RAG, to enhance the accuracy of the AI assistant's responses. Quickly verify accuracy by showing the assistant's answers are grounded in a PDF version of the document generated in step 1. Set up guardrails to prevent the AI assistant from responding to non-bank related requests. Then, ask several questions about a bank employee's salary to trigger the guardrails and data-leak prevention (DLP) measures. Present out-of-the-box reports that provide metrics such as comprehensiveness, accuracy, performance (response time), costs, and other metrics important to the marketing team.
  - Finally, build an Avatar/Digital Human for marketing and promotion of the services provided by the bank. This should be a photorealistic implementation capable of speaking at least two languages. Ground the avatar to the text and image generated from step 2. Ask the avatar a series of questions using audio/speech about why clients should choose the services from your bank on your platform. Allow the avatar to provide guidance in multiple languages and voice tones. The avatar should be able to show the menu items (or indicate a position on the menu or link to locate menu) it is discussing and be able to change the item based on the customer's questions. Test and demonstrate the avatar's guardrails by asking questions outside the bank's scope, showing that the guardrails are effective. ***If you cannot demo a multimodal avatar***

***without heavy reliance on third-party technology, simply state this. Do not spend demo time on technology that is predominately not your own.***

The demo should focus on the technical capabilities of your platform as of 1st August 2026. The depth of business domain knowledge is not a consideration.

- **Major Use Cases:** Present on how your product/service delivers differentiated value for each use case, based on the Use Cases defined in the Welcome Packet.
- **Major Critical Capabilities:** Present on how your product/service delivers differentiated value for each of the Critical Capabilities, based on the Critical Capabilities defined in the Welcome Packet:
  - We are interested in seeing if these Critical Capabilities are offered/not offered and how they are utilized to deliver on the defined Use Cases.
  - Showcase how you combine various capabilities to deliver the complex business Use Cases.
- **Differentiating Capabilities:** Present any capabilities that you believe separate you from your competitors.

***As part of your submission, provide a table of contents in a separate file for topics covered in the briefing.*** For each use case and area of differentiation, change [00:00] to the appropriate timecode (minutes and seconds within the video) where the topic starts.

***Please consider providing the following deliverables:***

1. Package and deliver the artifacts (source code) of each demo so that we can inspect and review them in an IDE or design studio on which they are developed.
2. Runtime executable of each demo, packaged in containers or helm charts so that we can deploy and validate on our own, either on-premises or in the cloud.
3. Provide the instruction, CLI, or automation script that can compile the source code (1) to deployable executables (2). Use a CI/CD pipeline if possible.

Thank you for your submission. We look forward to learning more about your product(s).
